1. INTRODUCTION:

- Overview:

Global warming is one of the biggest challenges currently being faced by the human race, although correlation is not causation, a likely cause of global warming is due to increased atmospheric carbon dioxide from human activities. **CO2 Emission** refers to the Carbon Dioxide emitted throughout the world.

For this analysis we will be focusing on CO2 Emissions and its effect on the world we live in as well as some key factors and stats that may play a role in the emission of CO2 globally. Fossil fuel use is the primary source of CO2. The data throws light onto how much fossil fuels are burnt, per year per nation, which amounts to an increase in CO2 every year. This will help researchers and environment experts to predict global warming. So countries should set a goal to decrease this amount yearly.

Analysing Global Co2 Emission across countries from 1975 to 2020. This dataset contains a record of Co2 Emission by each Country and Region of Earth, here we are going to analyse and visualise Country wise.

Region wise and Overall Co2 Emission on Earth.

● PURPOSE:

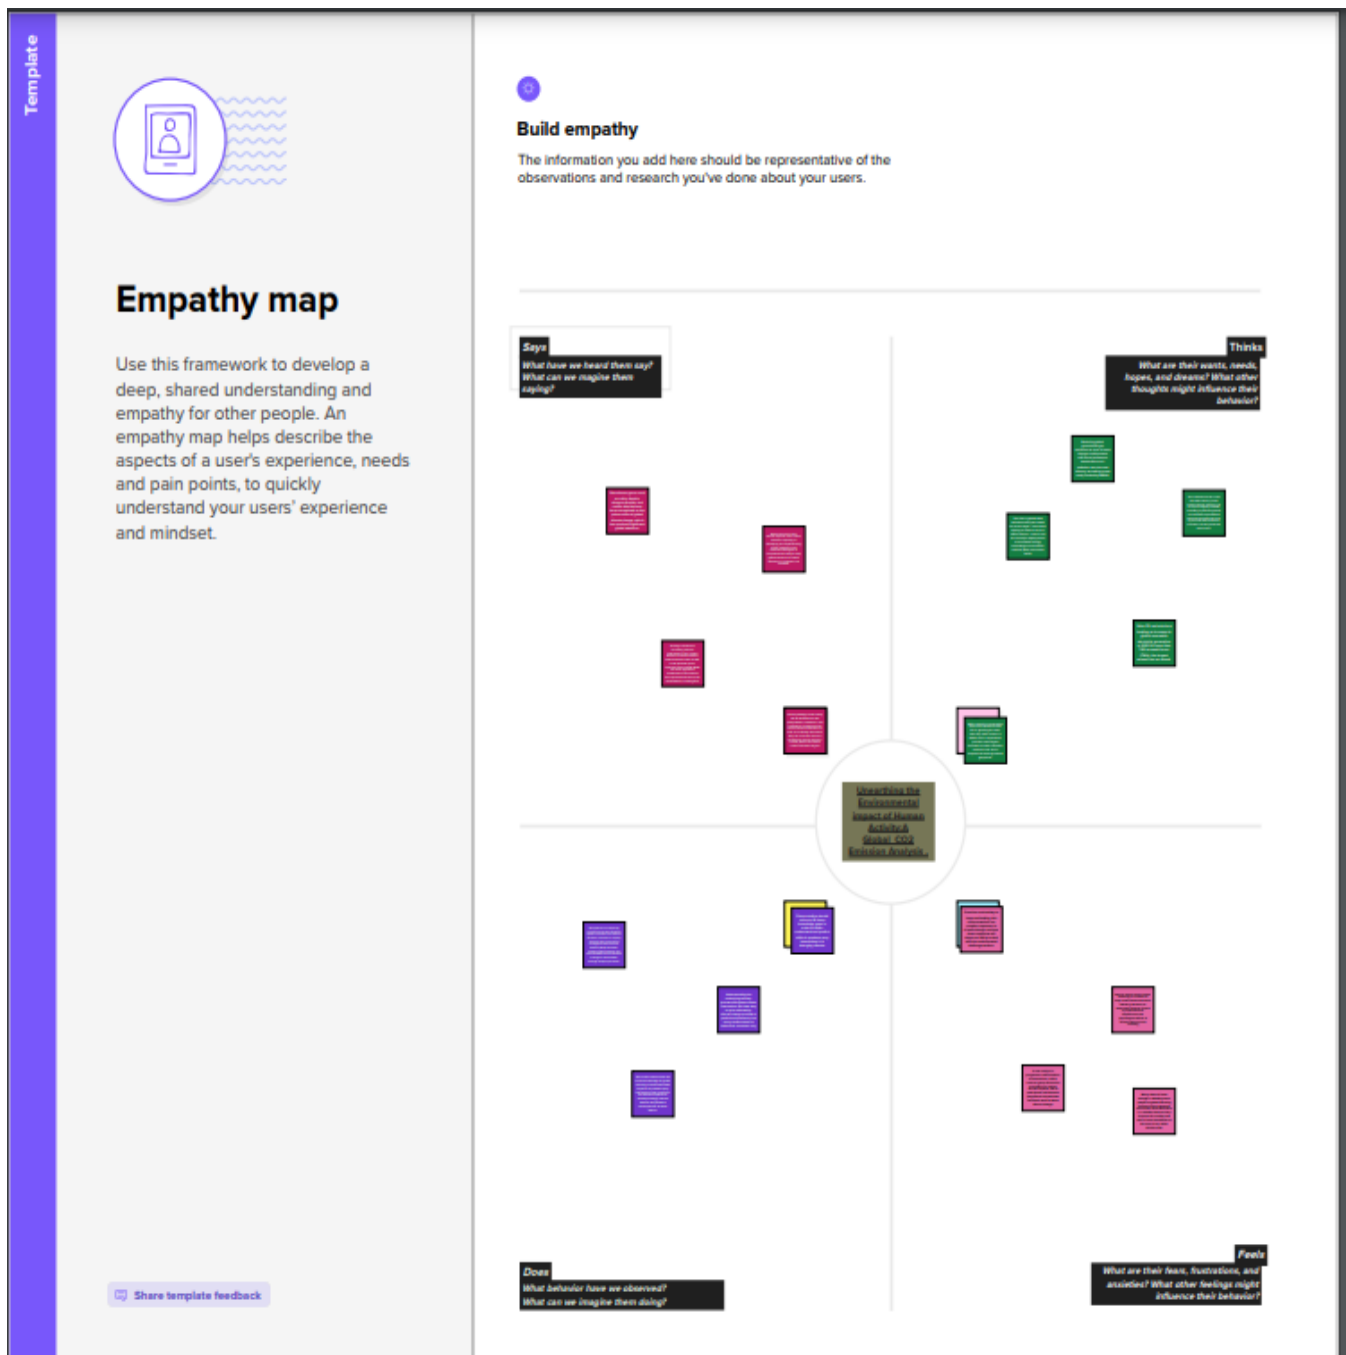

The carbon (and oxygen) in CO₂ can be used as an alternative to fossil fuels in the production of chemicals, including plastics, fibres and synthetic rubber. As with CO₂-derived fuels, converting CO₂ to methanol and methane is the most technologically

mature pathway. The methanol can be subsequently converted into other carbon-containing high-value chemical intermediates such as olefins, which are used to manufacture plastics, and aromatics, which are used in a range of sectors including health and hygiene, food production and processing.

A special group of chemicals, polymers, are used in the production of plastics, foams and resins. The carbon in CO₂ can be used in polymer production by replacing part of the fossil fuel-based raw material in the manufacturing process. Unlike the conversion of CO₂ to fuels and chemical intermediates, polymer processing with CO₂ requires little energy input, because CO₂ is converted into a molecule with an even lower energy state (carbonate). A number of companies are currently operating polymer plants using CO₂ as a raw material.

2.PROBLEM DEFINITION & DESIGN THINKING:

● EMPATHY MAP:

• IDEATION & BRAINSTORMING MAP:

Brainstorm & idea prioritization

Use this template to your own brainstorming sessions so your team can unleash their imagination and start ideating concepts even if you're not sitting in the same room.

10 minutes
 1 hour to 1 day
 2 people recommended

Start template feedback

Before you collaborate

A lot of ideas pop into your head only with this session. Here's what you need to do to get going.

1. Time planning
 Set a time for your session to brainstorm and make sure everyone is there for the full duration.

2. Set ground rules
 Tell your brainstorming session to be a safe space for everyone to share their ideas.

3. Create a safe space for collaboration
 Set up a space where everyone can share their ideas and make sure everyone is comfortable.

Open session

Define your problem statement

What problem are you trying to solve? Frame your problem as a clear, specific statement. This will be the focus of your brainstorm.

1. Problem statement
 Write down your problem statement.

2. Key idea of brainstorming
 Create a clear, specific statement of your problem.

3. Key idea of brainstorming
 Create a clear, specific statement of your problem.

4. Key idea of brainstorming
 Create a clear, specific statement of your problem.

Brainstorm

Write down any ideas that come to mind that address your problem statement.

1. Brainstorming session
 Write down any ideas that come to mind that address your problem statement.

2. Brainstorming session
 Write down any ideas that come to mind that address your problem statement.

3. Brainstorming session
 Write down any ideas that come to mind that address your problem statement.

4. Brainstorming session
 Write down any ideas that come to mind that address your problem statement.

Group ideas

Take some time to group your ideas into clusters. This will help you to see the bigger picture and to see how your ideas are related.

1. Group ideas
 Take some time to group your ideas into clusters. This will help you to see the bigger picture and to see how your ideas are related.

Prioritize

Now you should all be on the same page about which ideas are most important. Place your ideas in the grid to determine which ideas are important and which are feasible.

1. Prioritize
 Now you should all be on the same page about which ideas are most important. Place your ideas in the grid to determine which ideas are important and which are feasible.

2. Prioritize
 Now you should all be on the same page about which ideas are most important. Place your ideas in the grid to determine which ideas are important and which are feasible.

3. Prioritize
 Now you should all be on the same page about which ideas are most important. Place your ideas in the grid to determine which ideas are important and which are feasible.

4. Prioritize
 Now you should all be on the same page about which ideas are most important. Place your ideas in the grid to determine which ideas are important and which are feasible.

After you collaborate

You can repeat the process as often as you like to share with members of your company who might find it helpful.

1. After you collaborate
 You can repeat the process as often as you like to share with members of your company who might find it helpful.

2. After you collaborate
 You can repeat the process as often as you like to share with members of your company who might find it helpful.

3. After you collaborate
 You can repeat the process as often as you like to share with members of your company who might find it helpful.

4. After you collaborate
 You can repeat the process as often as you like to share with members of your company who might find it helpful.

4. ADVANTAGES & DISADVANTAGES:

● ADVANTAGES:

Technology more than other alternatives can easily retrofit into existing plants; High CO₂ concentration enhance sorption efficiency; fully developed technology, commercially deployed at the required scale in some industrial sectors; opportunity for retrofit to existing plant

Very high CO₂ concentration that enhances absorption efficiency; mature air separation technologies available; reduced volume of gas to be treated, hence required smaller boiler and other equipment; CO₂ combustion product, which remains unmixed with N₂, thus avoiding energy intensive air separation.

- **DISADVANTAGES:**

- Low CO₂ concentration affects the capture efficiency.

- Temperature associated heat transfer problem and efficiency decay issues associated with the use of hydrogen-rich gas turbine fuel; high parasitic power requirement for sorbent regeneration; inadequate experience due to few gasification plants currently operated in the market; high capital and operating costs for current sorption systems; High efficiency drop and energy penalty; cryogenic O₂ production is costly; corrosion problem may arise.

- Process is still under development and inadequate large scale operation experience.

5. APPLICATIONS:

1. CO₂-derived fuels:

The carbon in CO₂ can be used to produce fuels that are in use today, including methane, methanol, gasoline and aviation fuels. The process involves using the CO₂ in combination with hydrogen, which is highly energy-intensive to produce, and results in a carbon-containing fuel that is easier to handle and use than pure hydrogen (Figure 5). Low-carbon hydrogen can be produced from fossil fuels when combined with CCS, or through electrolysis of water using low-carbon electricity

2. CO₂-derived chemicals:

The carbon (and oxygen) in CO₂ can be used as an alternative to fossil fuels in the production of chemicals, including plastics, fibres and synthetic rubber. As with CO₂-derived fuels, converting CO₂ to methanol and methane is the most technologically mature pathway. The methanol can be subsequently converted into other carbon-containing high-value chemical

intermediates such as olefins, which are used to manufacture plastics, and aromatics, which are used in a range of sectors including health and hygiene, food production and processing.

3. Building materials from minerals and CO₂:

CO₂ can be used in the production of building materials to replace water in concrete, called CO₂ curing, or as a raw material in its constituents (cement and construction aggregates). These applications involve the reaction of CO₂ with calcium or magnesium to form low-energy carbonate molecules, the form of carbon that makes up concrete (Figure 7). CO₂-cured concrete is one of the most mature and promising applications of CO₂ use, while the integration of CO₂ in the production of cement itself is at an earlier stage of development.

4. Building materials from waste and CO₂:

Construction aggregates (small particulates used in building materials) can be produced by reacting CO₂ with waste materials from power plants or industrial processes. Among these are iron slag and coal fly ash, which would otherwise be stockpiled or stored in landfill.

Producing building materials from waste and CO₂ can be competitive as it offsets the cost associated with conventional waste disposal.

5. CROP YIELD BOOSTING WITH CO₂:

CO₂ can be used to enhance yields of biological processes, such as algae production and crop cultivation in greenhouses. The application of CO₂ with low-temperature heat in industrial greenhouses is the most mature yield-boosting application today, and can increase yields by 25% to 30%. The clear leader in the use of CO₂ in greenhouses is the Netherlands, with an estimated annual consumption between 5 and 6.3 MtCO₂. Of this amount, approximately 500 ktCO₂ per year comes from external sources, mainly industrial plants, with the balance taken from on-site gas-fired boilers or co-generation systems. The replacement of these on-site systems with other industrial CO₂ sources or with CO₂ captured directly from the atmosphere could deliver climate benefits.

6. CONCLUSION:

The rising level of atmospheric CO₂ could be the one global natural resource that is progressively increasing food production and total biological output, in a world of otherwise diminishing natural resources of land, water, energy, minerals, and fertilizer. It is a means of inadvertently increasing the productivity of farming systems and other photo synthetically active ecosystems. The effects know no boundaries and both developing and developed countries are, and will be, sharing equally, for "the rising level of atmospheric CO₂ is a universally free premium, gaining in magnitude with time, on which we all can reckon for the foreseeable future"

The relationship described above by where data pertaining to atmospheric CO₂ emissions, food production, and human population are plotted. Standardized to a value of unity in 1961, each of these datasets has experienced rapid and interlinked growth over the past five decades. Rising global population has led to rising CO₂ emissions and rising CO₂ emissions have benefited food production.

The very real positive externality of inadvertent atmospheric CO₂ enrichment *must* be considered in all studies examining the SCC; and its observationally-deduced effects *must* be given premier weighting over the speculative negative externalities presumed to occur in computer model projections of global warming. Until that time, little if *any* weight should be placed on current SCC calculations.

7. FUTURE SCOPE:

In the [Annual Energy Outlook 2022](#) (AEO2022) Reference case, which assumes no changes to current laws or regulations, the U.S. Energy Information Administration (EIA) projects that U.S. energy-related carbon dioxide (CO₂) emissions will fall to 4.5 billion metric tons in 2037, or 6% below the energy-related CO₂ emissions in 2021, before rising to 4.7 billion metric tons in 2050, or 2% below 2021 levels. Projected emissions decline from 2022 to 2037 primarily as a result of decreasing carbon intensity (CO₂ per unit of energy consumed) in the electric power sector. The rise in emissions from 2037 to 2050 is primarily due to increasing consumption. In the AEO2022 Reference

case, U.S. energy consumption grows from 2021 through 2050 because of population growth of 0.4% per year and real economic growth of 2.2% per year. Over the projection period, increasing CO₂ emissions from natural gas and petroleum consumption growth will offset declines in CO₂ emissions from coal consumption.

World CO₂ emissions are projected to increase

EIA's [*International Energy Outlook 2021*](#) (IEO2021)

Reference case projects that if current policy and technology trends continue, global energy consumption and energy-related CO₂ emissions will increase from 2020 through 2050 as a result of population and economic growth. However, projected future growth in energy-related CO₂ emissions is not evenly distributed across the world, and the majority of the projected future growth in energy-related CO₂ emissions is among the group of countries outside the [Organization for Economic Cooperation and Development \(OECD\)](#).
